A mixed quantum-classical approach to inelastic and reactive scattering is described. The approach is illustrated in detail for simple atom-diatom systems. The extension to a 3D treatment of diatom-diatom, atom — polyatom reactive scattering is also discussed.

The ultimate introduction, textbook, and reference on decoherence and the quantum-to-classical transition. This detailed but accessible text describes the concepts, formalism, interpretation, and experimental observation of decoherence and explains how decoherence is responsible for the emergence, from the realm of quantum mechanics, of the classical world of our experience.

On one side, a hybrid classical-quantum learning model takes classical input and evaluates a kernel function on a quantum devices, while classification is performed in the standard classical manner (e.g employing a SVM algorithm).

Kernel methods in Quantum Machine Learning

Classical algorithms and more recent methods are explained. Partial differential equations are treated generally comparing important methods, and equations of motion are solved by a large number of simple as well as more sophisticated methods. Several modern algorithms for quantum wavepacket motion are compared.

This article offers insight on translating proposed schemes to classical sampling methods and illustrates that the potential to find a classically intractable ensemble prone to a quantum speedup exists, which brings us closer to finding meaningful machine learning applications using ensemble techniques on quantum computers.

I first start by reminders of classical mechanics, probabilities and quantum mechanics, in their usual formulations in theoretical physics. This is mostly very standard material. The last section on reversibility and probabilities in quantum mechanics is a slightly more original presentation of these questions.

Classical mechanics is known often to offer a good description of molecular dynamical processes and hence this approach is widely used to simulate the dynamics of molecular systems. Classical mechanics allows for simulation of large systems. Large means in this connection systems consisting of several thousands of atoms or molecules.
